COMMERCIAL POULTRY INSURANCE & FINANCE INFRASTRUCTURE

Project Documentation | HackJos 2026

Track	Agri-Finance / Farmer Inclusion
Initial Market	Jos South LGA, Plateau State, Nigeria
Target Segment	Commercial poultry farms, initially focusing on farms with more than 2,000 birds

1. The Problem

Commercial poultry farms in Jos South face a financial protection gap: when disease outbreaks or other insured events cause significant losses, farmers risk losing their capital, while insurers and lenders lack a consistently structured way to assess and monitor the farms they finance or insure.

A farmer can invest millions of naira in birds, feed, medication, equipment and infrastructure. A disease outbreak or other major incident can destroy a substantial part of that investment. Without adequate insurance or access to recovery finance, the farmer may struggle to restart operations.

Even where insurance exists, insurers require reliable information about the farm, its flock, vaccination history, management practices and the incident that caused the loss. Collecting and assessing this information can involve significant administrative and fieldwork.

The same information gap affects agricultural lenders. A financial institution considering a poultry loan needs to understand the business, its operations, financial position and risks before committing capital. It also needs visibility into the financed operation after disbursement.

Research conducted among poultry farmers in Jos South reported:

Finding	Share of respondents
Experienced delays in insurance indemnity	69%
Reported delays in loss assessment	55%
Reported administrative bottlenecks	50%

The study included farms of different sizes. It does not establish that these problems occur at the same rate among large commercial farms, so that specific market segment requires further validation.

The central problem is therefore not the absence of another farm-management application. It is the lack of dependable, organised and usable farm information that can support insurance assessment, claims administration and agricultural lending decisions.

2. The Solution Model

Insurance and Finance Readiness Infrastructure

We will build a digital infrastructure that connects commercial poultry farms with insurance companies and agricultural lenders through structured farm information, operational records, risk monitoring and incident documentation.

The model has three participating sides

Participant	Role on the platform
Poultry farms	Maintain basic operational records, document farm activities, report incidents and provide information required by financial institutions.
Insurance companies	Use authorised farm information to support risk assessment, policy onboarding, incident documentation and claims administration.
Agricultural lenders	Banks and agricultural finance institutions use authorised farm information to support loan assessment, monitor financed farms and identify operational risks that could affect repayment.

How the model works

Stage 1: Farm onboarding and information capture

The farm is registered, and its operational structure is documented. Information includes:

- Farm location and ownership.
- Poultry houses and flock sizes.
- Bird types and production cycles.
- Vaccination and veterinary records.
- Mortality and production records.
- Feed and operational expenses.
- Available financial and business records.

Stage 2: Insurance readiness

The platform organises the information required by participating insurers. It helps identify missing documentation, supports pre-insurance information collection and makes relevant farm records available to authorised insurance partners.

The insurer remains responsible for underwriting, inspections, policy terms and issuance.

Stage 3: Financial assessment and loan facilitation

When a farm seeks financing, it can authorise a participating lender to access relevant business and operational information. The platform helps organise:

- Farm operating history.
- Production and revenue records.
- Existing assets and infrastructure.
- Operational expenditure.
- Insurance status, where applicable.
- Historical incidents and recovery records.

The lender uses this information alongside its own credit assessment, collateral requirements and verification processes.

Stage 4: Incident reporting and claims support

When a farm experiences a serious incident:

- The farmer reports the incident through the platform.
- Relevant details and supporting evidence are captured.
- Historical flock, vaccination, mortality and veterinary records are assembled.
- Required veterinary documentation and inspections are coordinated with authorised professionals and the insurer.
- A structured evidence package is made available to the insurer.
- The farmer can track requests and claims progress.

The insurer independently investigates, determines policy coverage and makes the settlement decision.

Stage 5: Recovery and continuity

Where a farm suffers a financial setback, the farmer may use the platform to prepare and submit a financing request to a participating lender. The lender independently determines eligibility, loan terms and approval.

Expected outcomes

- Better organised farm information for insurance and loan assessments.
- Reduced administrative work in collecting and reviewing farm documentation.
- Better visibility into the operations of insured and financed farms.
- More structured incident reporting and claims documentation.
- Improved ability for commercial poultry farms to demonstrate their operational and financial position.
- Better-informed decisions by participating insurers and lenders.

The platform supports these outcomes; it does not guarantee insurance approval, claim settlement, loan approval or faster payment.

3. The Ripple Effect

If the model works, its impact extends beyond the individual farmer.

Farmers and poultry businesses

- Better access to insurance and financing opportunities.
- Improved documentation of their businesses.
- Better ability to recover and restart after major losses.
- Reduced dependence on informal records when seeking institutional finance.

Insurance companies

- Better organised information for underwriting.
- More efficient claims documentation and administration.
- Improved visibility into insured farms.
- Potential reduction in avoidable inspection and documentation costs.

Agricultural lenders

- Better information for assessing agricultural borrowers.
- Improved monitoring of financed farms.
- Earlier visibility into operational problems that could affect repayment.
- More informed agricultural lending decisions.

Poultry value chain

- More resilient commercial poultry businesses.
- Better continuity of poultry production after major losses.
- Greater confidence among suppliers, distributors and other businesses serving poultry farms.

Food supply and the wider economy

When commercial poultry businesses can manage risk and recover from serious losses, disruptions to poultry and egg production may be reduced. This can contribute to a more resilient domestic poultry supply chain, support jobs and help protect investments across the value chain.

These are expected effects, not guaranteed outcomes. Their scale will depend on adoption, institutional participation and measurable improvements in farm recovery and financing.

4. The Product

Product Overview

A digital platform connecting commercial poultry farms, insurance companies and agricultural lenders through farm information management, insurance readiness, claims support and financing facilitation.

Core Product Modules

A. Farm Management

- Farm and poultry-house registration.
- Flock and production-cycle management.
- Bird stock and mortality records.
- Vaccination and veterinary records.
- Feed and operational expense records.
- Egg and production tracking.

B. Insurance Management

- Insurance information and policy records.
- Insurance readiness checklist.
- Required-document tracking.
- Policy status and renewal reminders.
- Authorised information sharing with insurers.

C. Incident and Claims Management

- Incident reporting.
- Evidence and document collection.
- Veterinary documentation coordination.
- Claims evidence package generation.
- Inspection and documentation tracking.
- Claims status monitoring.

D. Finance Readiness

- Farm business profile.
- Production and operational history.
- Financial record organisation.
- Financing application preparation.
- Authorised lender access to relevant farm information.
- Loan application status tracking.

E. Institutional Dashboard

For participating insurers and lenders:

- Authorised farm profiles.
- Farm information and document review.
- Insurance onboarding support.
- Claims documentation workflow.
- Financed-farm monitoring.
- Incident alerts and reporting.
- Audit trail and activity history.

Initial MVP Scope

The first version will focus on commercial poultry farms in Jos South. It will include:

1. Farm registration and onboarding.
2. Poultry-house and flock management.
3. Basic operational and veterinary records.
4. Insurance readiness and policy information.
5. Incident reporting and claims documentation.
6. Farm business profiles for financing applications.
7. An institutional dashboard for authorised insurer and lender users.

The MVP will demonstrate the complete workflow using participating farms and clearly labelled simulated cases where necessary.

We will not initially build a lending institution, insurance company, loan marketplace, insurance underwriting engine or automated credit-scoring system.

5. Revenue Model

Core Principle

Farmers should be able to use the basic platform for free. Institutions pay for services that improve their operations, reduce costs or help them acquire and manage customers. The business will follow an institution-funded B2B2B model.

Revenue Stream 1: Insurance Acquisition and Onboarding Services

Insurance companies pay for qualified commercial poultry farms introduced and successfully onboarded through an approved partnership arrangement. Possible commercial structures:

- Agreed fee for successful policy onboarding.
- Contracted farm acquisition and onboarding services.
- Ongoing service fees for supported insured-farm portfolios.

Any commission or insurance distribution remuneration must follow applicable NAICOM licensing and partnership requirements.

Revenue Stream 2: Claims Administration and Documentation Services

Insurance companies pay us to provide agreed operational services, such as:

- Collecting and organising farm records.
- Coordinating incident documentation.
- Arranging veterinary evidence through authorised professionals.
- Preparing structured claims documentation.
- Tracking outstanding documentation and inspection requests.

The insurer retains control of claims assessment and settlement.

Revenue Stream 3: Institutional Risk Monitoring Contracts

Banks, agricultural lenders and agribusinesses pay for monitoring and reporting services covering farms they finance or have commercial relationships with. This may include:

- Farm operational reporting.
- Incident alerts.

- Production and business performance information.
- Documentation updates.
- Portfolio monitoring dashboards.

This revenue stream will be pursued after validating actual institutional demand.

Revenue Stream 4: Institutional Technology and Integration Contracts

Participating insurers and lenders may pay for:

- Integration with their internal systems.
- Secure data exchange.
- Custom reporting.
- Workflow configuration.
- Enterprise support and maintenance.

These services will be negotiated according to institutional requirements.

What Farmers Pay

Basic farm registration, operational records, incident reporting and access to their own information will remain free in the initial model. We will not charge farmers simply to submit an insurance claim or access basic farm records.

Optional paid services may be introduced later only where they provide a clearly additional, demonstrable benefit and farmers willingly choose them.

Revenue Priorities

1. Insurance acquisition and onboarding arrangements.
2. Contracted claims documentation and administration.
3. Institutional risk monitoring.
4. Technology integration and enterprise contracts.

No revenue figures or pricing have been assumed because willingness to pay and contract economics still need to be validated.

6. Business Model

The business operates as an infrastructure and service provider connecting commercial poultry farms with institutions that insure and finance them.

Element	Description
Value creation	We organise farm information and provide operational workflows that make insurance and agricultural lending processes more efficient.
Value capture	We earn institutional service fees, approved acquisition remuneration, monitoring contract fees and technology integration revenue.
Market entry	Begin with commercial poultry farms in Jos South, establish institutional partnerships, demonstrate operational value and expand to other locations after validation.

Target Customers

Primary institutional customers

- Agricultural insurance companies.

- Commercial banks.
- Microfinance banks.
- Agricultural development finance institutions.

Platform users

- Commercial poultry farm owners.
- Farm managers.
- Veterinary professionals.
- Insurance officers.
- Agricultural loan officers.

7. Key Institutions and Proposed Partners

The following are prospective institutions to approach. They are not confirmed partners, and their participation must be secured through formal discussions and agreements.

A. Insurance Partners

1. Nigerian Agricultural Insurance Corporation (NAIC)

Website: https://naic.gov.ng/

Priority: First institutional approach.

Why:

- Specialises in agricultural insurance.
- Provides livestock insurance that includes poultry.
- Has an established agricultural insurance and claims function.
- Provides insurance coverage for agricultural assets and supports institutional lending through agricultural risk protection.

Proposed collaboration:

- Poultry farm insurance onboarding.
- Insurance information requirements.
- Claims documentation workflow.
- Farm risk information and reporting.
- Potential pilot involving commercial poultry farms.

2. AIICO Insurance PLC

Website: https://www.aiicoplc.com/

Why:

- Publicly offers poultry farm insurance.
- Covers different commercial bird categories.
- Its published requirements include farm inspection, risk management and biosecurity information.

Proposed collaboration:

- Commercial poultry insurance onboarding.
- Farm information standardisation.
- Risk assessment documentation.
- Claims evidence workflow.

3. Leadway Assurance Company Limited

Website: https://www.leadway.com/

Why:

- A NAICOM-listed insurance company.
- A potential institutional insurance partner to approach for agricultural insurance and digital operational collaboration.

Proposed collaboration:

- Explore poultry insurance product requirements.
- Discuss digital farm information and claims workflow integration.
- Assess whether it has a commercial poultry portfolio suitable for a pilot.

B. Loan and Agricultural Finance Partners

1. Gowans Microfinance Bank

Website: Verify its official contact and website before outreach.

Priority: First local lending institution to approach.

Why:

- Has a documented history of providing financing to poultry businesses in Plateau State.
- A GIZ case study describes a Plateau poultry operator who accessed financing through Gowans Microfinance Bank after suffering a major poultry loss.

Proposed collaboration:

- Commercial poultry loan referrals.
- Farm information and business-profile assessment.
- Monitoring of financed poultry businesses.
- Pilot testing of structured farm information for loan applications.

2. Bank of Agriculture (BOA)

Website: https://boanig.com/

Why:

- Provides agricultural financing to individuals, SMEs, cooperatives and corporate businesses.
- Offers corporate and commercial loan products.

Proposed collaboration:

- Commercial poultry financing referrals.
- Farm business documentation.
- Financing readiness support.
- Institutional monitoring arrangements.

3. NIRSAL Microfinance Bank (NMFB)

Website: https://nmfb.com.ng/

Why:

- Provides agricultural and SME financing facilities.
- Operates financing programmes including AGSMEIS and other lending products.

Proposed collaboration:

- Financing referrals for eligible poultry businesses.
- Structured farm business information.
- Loan application documentation.
- Monitoring arrangements where agreed.

4. FirstBank of Nigeria

Website: https://www.firstbanknigeria.com/

Why:

- A potential commercial banking partner for structured agricultural and commercial enterprise financing.
- FirstBank is identified among participating institutions in the agricultural credit scheme information published through Nigeria's eAgriculture portal.

Proposed collaboration:

- Commercial poultry business financing.
- Structured loan assessment information.
- Potential participation in agricultural financing programmes.

C. Strategic Finance and Risk-Sharing Partner

NIRSAL Plc

Website: https://nirsal.com/

Role: Agricultural finance de-risking and institutional facilitation, not direct lending.

NIRSAL Plc is distinct from NIRSAL Microfinance Bank. It is not a bank and does not directly issue loans to farmers. Its mandate includes facilitating agricultural finance and providing credit-risk guarantees and risk-management support to financial institutions.

Proposed collaboration:

- Introductions to participating financial institutions.
- Explore credit-risk guarantee arrangements with eligible lenders.
- Develop a structured commercial poultry financing model.
- Explore institutional farm-risk monitoring and project oversight.

D. Regulatory Institution

National Insurance Commission (NAICOM)

Website: https://naicom.gov.ng/

Role:

- Regulatory guidance on insurance-related platform operations.
- Clarification of applicable licensing requirements.
- Guidance on compliant partnerships with insurance institutions.

NAICOM's Guidelines for Insurtech Operations in Nigeria took effect on 1 August 2025. They require regulatory approval or a valid licence for relevant insurtech operations and insurance-institution partnerships. We must determine the appropriate regulatory route before conducting regulated insurance activities.

8. Business Model Canvas (BMC)

BMC Component	Description
Customer Segments	Commercial poultry farms; agricultural insurance companies; commercial banks; microfinance banks; agricultural finance institutions.
Value Propositions	Organised farm information; better insurance readiness; structured claims documentation; improved agricultural loan assessment; monitoring of financed and insured farms.
Channels	Direct farm onboarding; poultry associations; insurer partnerships; lender partnerships; veterinary networks; agricultural business networks.
Customer Relationships	Free farmer access; institutional service agreements; onboarding support; technical assistance; dedicated enterprise account management.
Revenue Streams	Insurance acquisition and onboarding services; contracted claims administration; institutional risk-monitoring contracts; enterprise technology and integration services.
Key Activities	Farm onboarding; data organisation; platform development; insurance documentation workflows; financing readiness; incident reporting; institutional integration; customer support.
Key Resources	Digital platform; structured farm information; engineering team; institutional relationships; veterinary network; security and data governance infrastructure.
Key Partnerships	NAIC; AIICO; Leadway; Gowans MFB; Bank of Agriculture; NIRSAL Microfinance Bank; FirstBank; NIRSAL Plc; veterinary professionals; Plateau poultry associations.
Cost Structure	Product development; hosting and infrastructure; security; field onboarding; institutional integration; veterinary coordination; customer support; compliance and legal costs.

9. Market Entry and Implementation

Phase 1: Validation and Institutional Engagement

- Interview commercial poultry farm owners and managers in Jos South.
- Validate the reported insurance and claims challenges with actual commercial farms.
- Establish how insurers currently onboard, inspect and assess poultry farms.
- Understand the operational cost of claims documentation and farm inspections.
- Meet prospective lending institutions to understand their poultry loan assessment and monitoring processes.
- Confirm regulatory requirements and the appropriate partnership structure.

Deliverable: Validated problem, institutional requirements and at least one prospective pilot partner.

Phase 2: MVP Development

- Build farm onboarding and operational records.
- Implement insurance readiness.
- Develop incident reporting and claims documentation.
- Build farm financing profiles.
- Develop institutional dashboards and access controls.

Deliverable: Working MVP tested with commercial poultry farms.

Phase 3: Pilot Deployment

- Onboard a selected group of commercial poultry farms.
- Test farm record collection and maintenance.
- Run simulated incident and claims workflows.
- Test authorised farm information sharing with an insurer.
- Test financing documentation and monitoring with a lender.
- Measure the time, cost and completeness of the relevant workflows.

Deliverable: Evidence that the platform solves a real institutional problem and provides measurable value.

Phase 4: Commercialisation

- Secure paid institutional contracts.
- Expand farm onboarding through partner channels.
- Integrate with institutional systems where justified.
- Expand to additional poultry-producing areas.
- Consider other livestock segments only after the poultry model is proven.

10. Success Metrics

The project should be evaluated using measurable operational outcomes.

Area	Metrics
Farm adoption	Number of commercial poultry farms onboarded. Percentage of farms maintaining usable records. Number of active farms using incident reporting.

Area	Metrics
Insurance outcomes	Number of farms successfully onboarded by insurance partners. Completeness of claims documentation. Time required to assemble claims evidence. Insurer administrative cost per supported case.
Financing outcomes	Number of farms referred to participating lenders. Number of financing applications submitted. Loan approval and disbursement rates. Time required to prepare financing documentation. Number of financed farms monitored.
Business sustainability	Number of paying institutional partners. Institutional contract revenue. Cost of onboarding and supporting each farm. Institutional retention and renewal.

11. Key Assumptions and Risks

#	Area	Assumption or risk
1	Institutional willingness to pay	Insurers and lenders must confirm that the platform solves a sufficiently costly problem to justify payment.
2	Farmer participation	Farmers must see practical value in sharing and maintaining operational information, even when basic access is free.
3	Data reliability	Farm records must be sufficiently accurate and verifiable to be useful in institutional decisions.
4	Regulatory compliance	Insurance distribution, policy-related activities and partnerships must comply with NAICOM requirements. Lending decisions remain with licensed financial institutions.
5	Data protection	Farm and personal information must be protected, shared only with appropriate authorisation and handled in line with applicable Nigerian data protection requirements.
6	Product differentiation	The platform must complement existing insurer portals and lender systems rather than duplicate their services.
7	Commercial validation	The initial focus on farms with more than 2,000 birds is a market-selection hypothesis, not an official definition of a large commercial farm.

12. Project Summary

We are building an Insurance and Finance Readiness Infrastructure for Commercial Poultry Farms, beginning in Jos South, Plateau State.

The problem is that commercial poultry businesses face significant financial exposure to operational losses, while insurers and lenders need reliable farm information to assess, insure, finance and monitor those businesses.

Our solution provides a shared digital infrastructure for farm information, insurance readiness, incident documentation, claims support and financing assessment.

Farmers access the basic platform free of charge. Insurance companies and agricultural lenders pay for measurable services that improve customer acquisition, documentation, claims administration, risk monitoring and financing operations.

The expected impact is stronger financial protection for poultry businesses, better-informed agricultural lending, more efficient insurance operations and improved resilience across the poultry value chain.

> **Our business is not to charge farmers for another farm application. It is to make commercial poultry businesses easier to insure, easier to assess for financing and easier to support when losses occur.**
